Summary

Software Development Engineer I – Backend with hands-on experience building scalable microservices using Java and Scala. Contributing to a global Manufacturing Execution System processing millions of real-time production events across 60+ factories. Strong foundation in data structures, system design fundamentals, and database optimization. Seeking backend roles in product-driven startups or top-tier technology companies.

Experience

Software Engineer, Solvei8 – Noida, India Apr 2025 – present

- Backend engineer on Tracki8, a Manufacturing Execution System (MES) used by 60+ factories for real-time production and quality tracking.
- Developed and maintained microservice-based backend services and REST APIs using Java, Scala (Play Framework), and Spring Boot.
- Worked on manufacturing workflows including RFID tracking, WIP monitoring, Scan & Pack, and Set/Combo packing.
- Implemented RFID-based bulk scanning to support simultaneous garment scanning and reduce manual processing.
- Built Quality Control (QC) services to generate measurement-based reports for production monitoring.
- Designed and optimized MongoDB aggregations and PostgreSQL schemas, including database migration scripts.
- Worked on Kafka-based event publishing to enable near real-time analytics in Flink via Druid.
- Resolved backend bugs and feature requests, participated in sprint planning, daily standups, and code reviews, reducing client-reported issues by ~25%.

Software Developer Intern, Viral Fission – Mumbai, India July 2024 – Dec 2024

- Architected notification system using Redis and Kafka, replacing inefficient cron-based monitoring to improve real-time performance and system reliability.
- Enhanced API error handling with Global Exception Handler and custom exceptions, streamlining integration for mobile developers and reducing debugging time.
- Developed corporate website backend with CMS capabilities for dynamic content management and implemented environment-specific configurations using Spring Boot best practices.

Projects

Blogger Hub

- Spring Boot backend with JWT + OTP verification and Redis caching securing user auth, profiles, and blog CRUD.
- Cloudinary-backed media pipeline for profile/blog assets, documented via Swagger/Postman and built with Maven.
- Kafka-driven notification system with Spring profiles enabling clean multi-environment deployments.

Oppia

Contributed to Oppia's educational platform, a Python and Angular-based web application.

- Accelerated Translation Processes: Built features within the Oppia platform to automate translatable exploration creation, significantly reducing the time and effort by 60%.
- Improved Contributor Experience: Helped improve average contribution quality score by 10% through guidance and mentorship to contributors.

Skills

Programming Languages: Java, Scala, Python, JavaScript, Kotlin

Frameworks & Tools: Flask, Django, Spring Boot, Play Framework, Git, GitHub, BitBucket

Databases & Messaging: MongoDB, PostgreSQL, MySQL, Redis, Kafka, Druid, Flink

Education

KIET Group of Institutions, B. Tech in Information Technology – Delhi NCR Nov 2021 – June 2025

- Coursework: Data Structure & Algorithm, Database Management System, Operating System, Computer Networks, Web Technology (Servlet & JSP)
